Player Version 4.2 is released

Player 4.2 is now available to all our clients. At the heart of the new version is our newly developed 'QwikEval' suite of prospect volumetric tools. 'QwikEval' is comprised of a suite of different volumetric tools that includes:

QwikVol, AreaVol & ScoutVol.

QwikVol is a fully stochastic Monte Carlo prospect volumetric tool which is the first genuinely spatial prospect tool ever made available to the industry. You have always wanted to see what porosities/net to gross/sand thicknesses etc you put into nearby prospects and what the values were in nearby wells and fields and how these values compare against depth/temperature or GDE maps etc and now you can in one click of a button!

AreaVol is an Area vs Volume (area yield) methodology where you can use existing pool +/- prospect data to estimate prospect volumes in seconds. Lastly, **ScoutVol** allows you to capture and correct farm-out estimates in a transparent way.

Our existing toolset is unique in the market today and highlights our ability to integrate real prospects into our play assessments. We can measure the de-risking impact of prospects on overall portfolios to identify game-changer opportunities and our workflow can rank blocks and plays by volume and/or value. We believe we have delivered an industry leading integrated solution for all teams working on both held acreage and new business evaluations.

Player 4.2 upgrade - Get QwikEval - Please contact: support@gis-pax.com

Player annual UGM - Tuesday November 14th. Invites and Player 2018 development options will be sent to our clients by mid October.
